Texas and Variable Speed Limits

- ▶ Background
- ▶ Planning deployments
- ▶ Software changes
- ▶ Pilot project operations
- ▶ Lessons learned

Background

- ▶ Texas Legislation currently does NOT allow for variable speed limits
- ▶ May 2013 Texas State Legislature approved and required a pilot program to evaluate variable speed limits (VSL) to be completed by Feb 2015
 - ▶ Weather conditions
 - ▶ Congestion
 - ▶ Construction
 - ▶ Other conditions warranting temporary lower speed limits

Deployment Planning

- ▶ Hardware
- ▶ Location selection
- ▶ Physical deployment planning
- ▶ Planning for operations

VSL Hardware

- ▶ Communication and power
- ▶ VSL signs
 - ▶ Allow speed limit to change
 - ▶ May be on the side of the road or over lanes
- ▶ Traffic detection devices
 - ▶ Provide congestion information
- ▶ Weather devices
 - ▶ Friction
 - ▶ Visibility

Communication & Power

▶ Communication

- ▶ In locations selected, fiber communication was not in place
- ▶ Cellular modems
- ▶ VSL and radar detection on same modem

▶ Power

- ▶ No infrastructure in the selected locations
- ▶ Used solar power and batteries

VSL Signs

- ▶ Typical VSL signs are similar to normal speed limit signs with a 2 digit changeable message used for the speed limit
- ▶ Lead time for the project was too short for a procurement turn around, so portable message signs were used with an overlay
 - ▶ LEDs were not as bright—changed to brighter ones part way through pilot

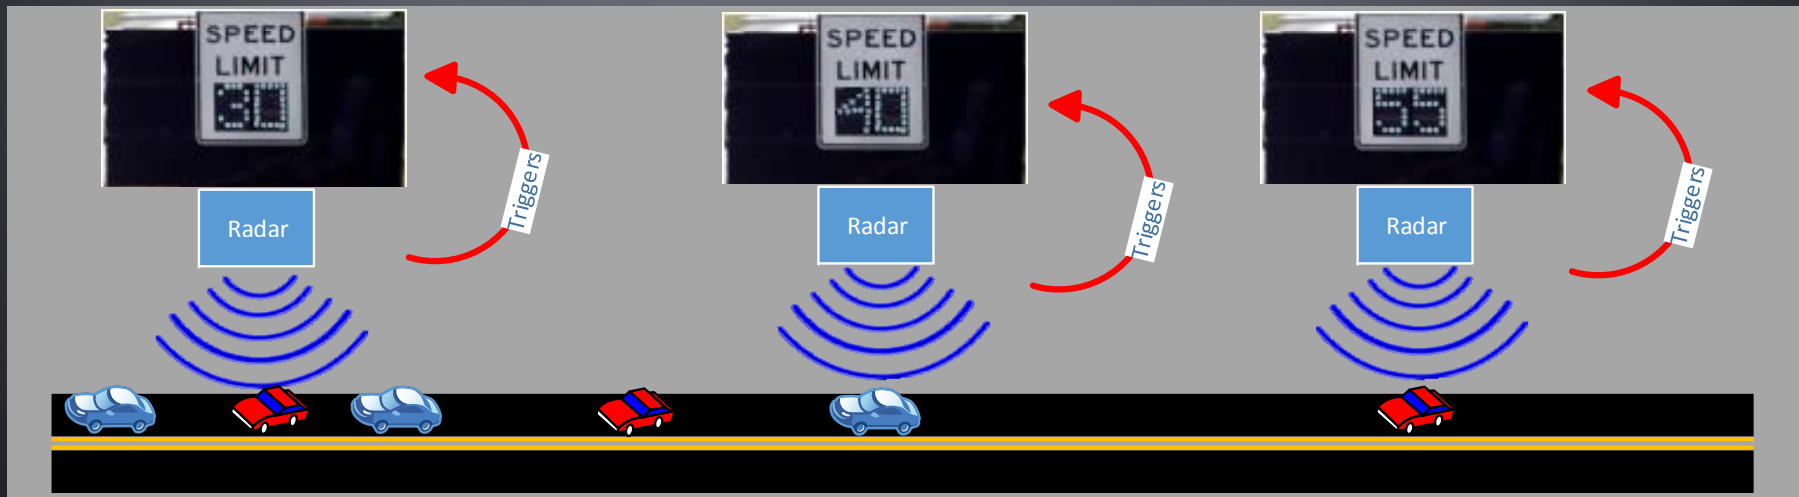

Typical Traffic Detection

- ▶ Radar or other detection device
- ▶ Typically, detection and VSL signs would be staggered
- ▶ This allows downstream traffic to trigger speeds as shown in the picture

Traffic Detection for Pilot

- ▶ Wavetronix HD Smart Sensor radar
- ▶ Detection was co-located with the VSL signs
 - ▶ Solar power was at the VSL sign
 - ▶ Less infrastructure to deploy

Weather Devices

- ▶ Selected devices

- ▶ Non-intrusive (no installation into the roadway)
- ▶ Public, simple XML or ASCII protocol

- ▶ Visibility

- ▶ Sensor selected was Sentry
- ▶ Provided visibility in feet

- ▶ Friction

- ▶ Sensor selected was IceSight
- ▶ Measured co-efficient of pavement friction

Location Selection

- ▶ Interested in evaluating several conditions where VSL could assist
 - ▶ Congestion and queue formation
 - ▶ Required area where regular congestion occurred
 - ▶ Weather
 - ▶ Weather could be a factor in other conditions as well, but looking for a site with recurring weather conditions causing traffic problems
 - ▶ Construction
 - ▶ Looking for location where construction and lane closures caused queue formation

Congestion Location-Urban

- ▶ San Antonio area selected
 - ▶ Loop 1604 Westbound
 - ▶ Recurring congestion most mornings and afternoons
 - ▶ Room on side of the roadway for the portable message signs
 - ▶ No construction anticipated (to isolate congestion for the results of the pilot)

Construction Location-Suburban

- ▶ Temple in the TxDOT Waco district
 - ▶ Section of IH-35 Southbound
 - ▶ Lane closures further downstream often caused queues to form

Weather Location-Rural

- ▶ Ranger Hill in Eastland County (Brownwood District) on IH-20
 - ▶ Steep grade on the hill with a curve in the roadway
 - ▶ History of icy roads and foggy conditions

Physical Deployment Planning

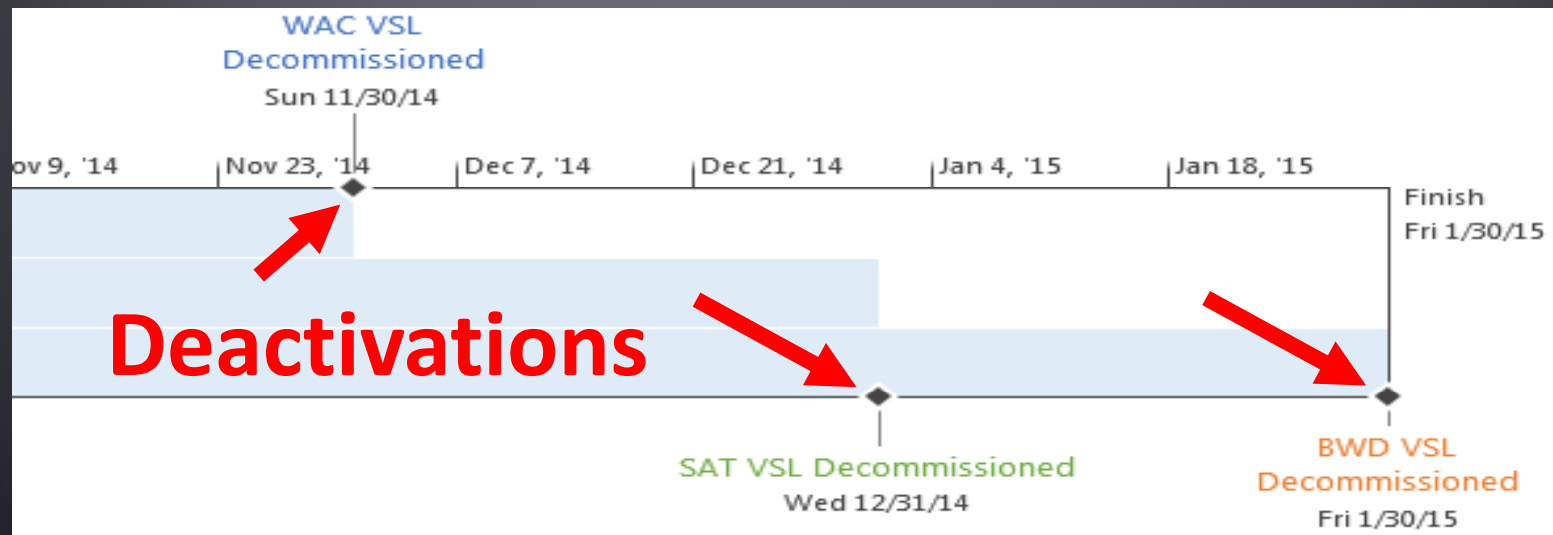

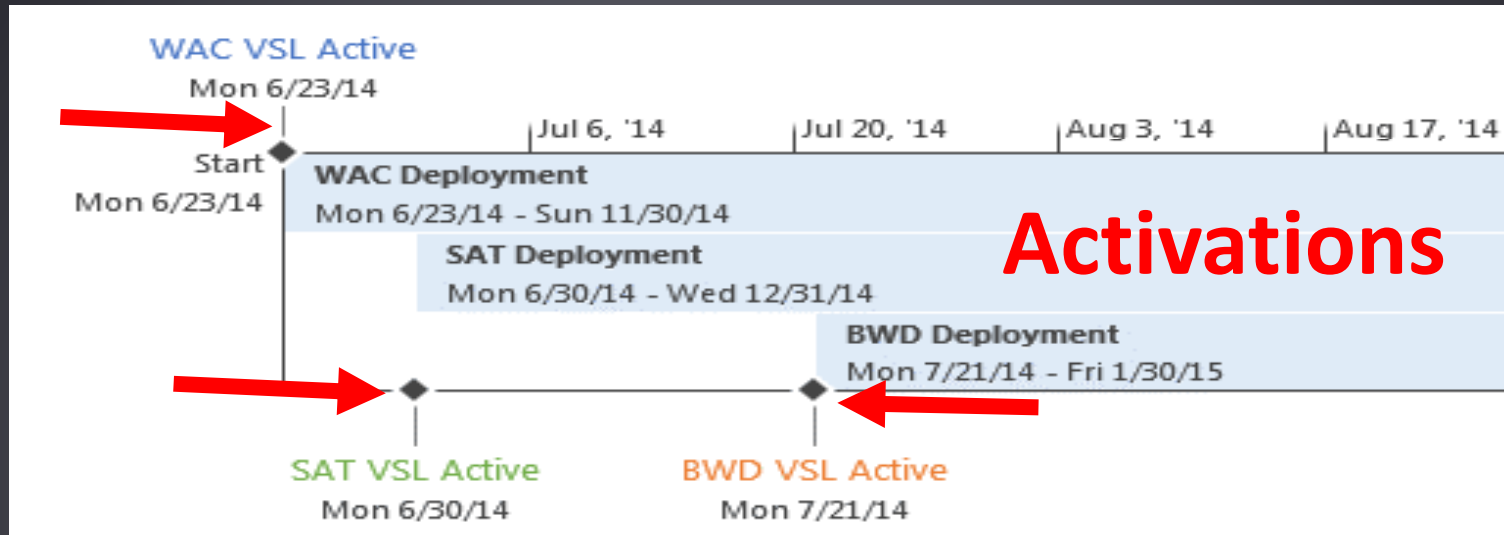

- ▶ Deployments were staggered over time
 - ▶ Lessons learned in initial deployment could be applied to subsequent ones
 - ▶ “No VSL” traffic data was collected after initial deployment but before VSL was activated
- ▶ Deactivation of VSL was also staggered
 - ▶ Allowed additional weather data to be collected on Ranger Hill

Planning for Operations

- ▶ Required integration with statewide traffic management software, Lonestar
 - ▶ Determine algorithms for software
 - ▶ What data collection was required for evaluation of the pilot?
 - ▶ How would the maintenance company be notified of hardware problems?
- ▶ Needed an operations view of the system
 - ▶ Webpage with login
 - ▶ Data could be viewed or downloaded

Deployment Timeline

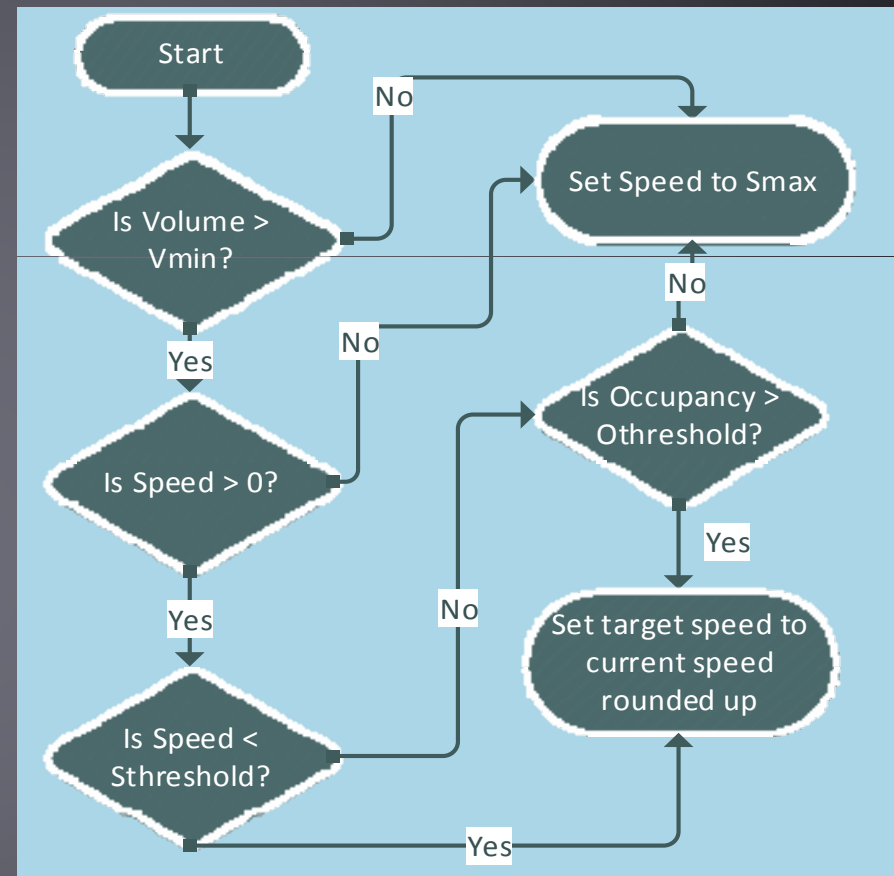

Software Changes

- ▶ Lonestar
 - ▶ Selected detector, Wavetronix HD, already supported
 - ▶ Support for selected weather devices was added
 - ▶ Added VSL functionality
 - ▶ Added notifications (operator alerts and email notifications) for:
 - ▶ Device failures
 - ▶ VSL plans suggested, activated, and deactivated
- ▶ VSL website for status and data download

Congestion Algorithm

- ▶ Detector data evaluated
- ▶ Do we have enough cars?
- ▶ Is the speed less than our threshold (50 MPH)
- ▶ If so, that VSL sign's target speed is set to the reported speed
- ▶ Activation waits until a configurable number of times lower speed limits are triggered

Weather Algorithm

		$F \geq F^{UT}$	Good	$F^{LT} < F < F^{UT}$	Moderate	$F \leq F^{LT}$	Poor
$V > V^T$	Good	Normal speeds		Speed1		Speed2	
$V \leq V^T$	Poor	Speed3		Speed4		30 MPH	

- ▶ Two thresholds for friction were used based upon impact to traffic speeds
 - ▶ Upper: Moderate-high—heavy rain, actively flowing water
 - ▶ Lower: Low-moderate—lighter rain, roads still wet
- ▶ Visibility used a single threshold
- ▶ Either congestion or weather could activate VSL
 - ▶ Lowest triggered speeds would be used

VSL Activation: Sample Values

Congestion forming downstream triggers reduced speeds back to initial VSL sign

As congestion increases further upstream, speed limits are lowered

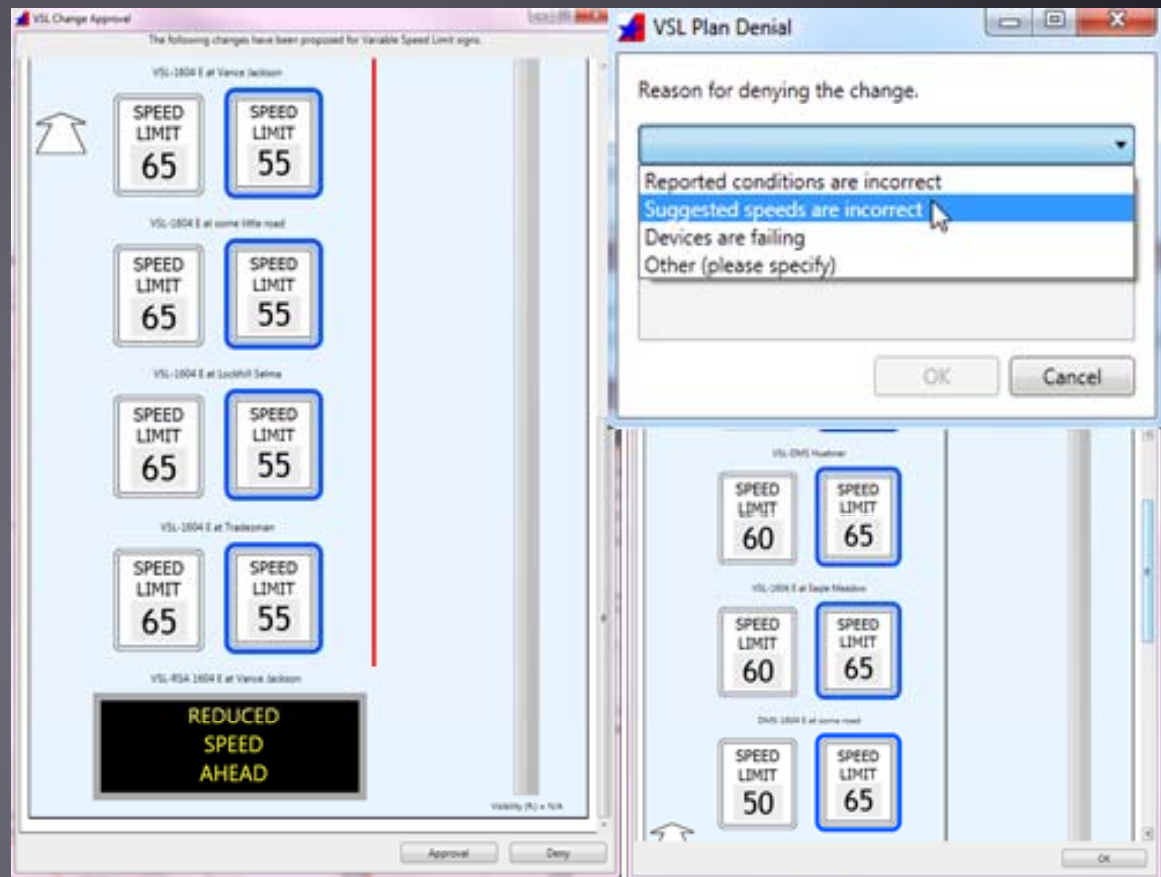

Activation Approvals

- ▶ Activations were required to be approved by an operator
- ▶ For the suburban and rural locations, operations are NOT 24/7
- ▶ Operator approval occurred at the regional center, Fort Worth (FTW) in both cases
 - ▶ Remote Command Application (RCA) updated to allow approval information to be passed to the controlling district

Lonestar VSL Activation Alert

- ▶ Operators approved activations (legislatively required)
- ▶ If denied, a reason was selected
- ▶ Once activated, speed limits were automatically adjusted during the activation time frame
- ▶ Emails notifications were sent to district personnel

VSL Website Functionality

SOUTHWEST RESEARCH INSTITUTE

Active plan information was displayed including weather/traffic conditions

Plan: VSL-150122-010818-0

Proposal Time: 1/22/2015 1:08:18 PM Initiation Time: 1/22/2015 1:19:27 PM Operator: rca_ftw:BWD-ITS-APP3:5524 [Hide Trigger Conditions](#)

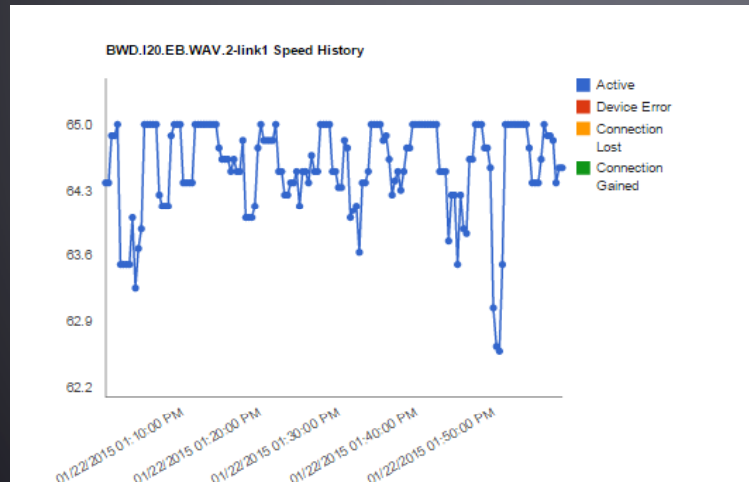

BWD.I20.EB.RSA.1	BWD.I20.EB.VSL.1	BWD.I20.EB.VSL.2	BWD.I20.EB.VSL.3	BWD.I20.WB.RSA.1	BWD.I20.WB.VSL.1	BWD.I20.WB.VSL.2	BWD.I20.WB.VSL.3
REDUCED SPEED AHEAD	SPEED LIMIT 55	SPEED LIMIT 55	SPEED LIMIT 55	REDUCED SPEED AHEAD	SPEED LIMIT 60	SPEED LIMIT 55	SPEED LIMIT 55

VSL Plan Triggering Conditions

Congestion Friction Visibility Construction

BWD.I20.EB.PSC.1	Surface Friction	40%	100%
BWD.I20.EB.VIS.1	Visibility	11865 ft	11865 ft

Also available were traffic and weather detection values and VSL status over time

VSL Pilot Operations Summary

- ▶ Slight algorithm modifications were made after initial deployment
 - ▶ Require consecutive triggers before activating to prevent quick activation/deactivation sequences
 - ▶ Initially applied to deactivation as well, but removed as quicker return to normal speed limits was desired
 - ▶ Friction thresholds were initially set too high
 - ▶ At 70% friction, traffic returned to normal speeds and roads were not hazardous
 - ▶ Recovery to a “dry road” condition took too long as the sensors were over the shoulder rather than the main lanes

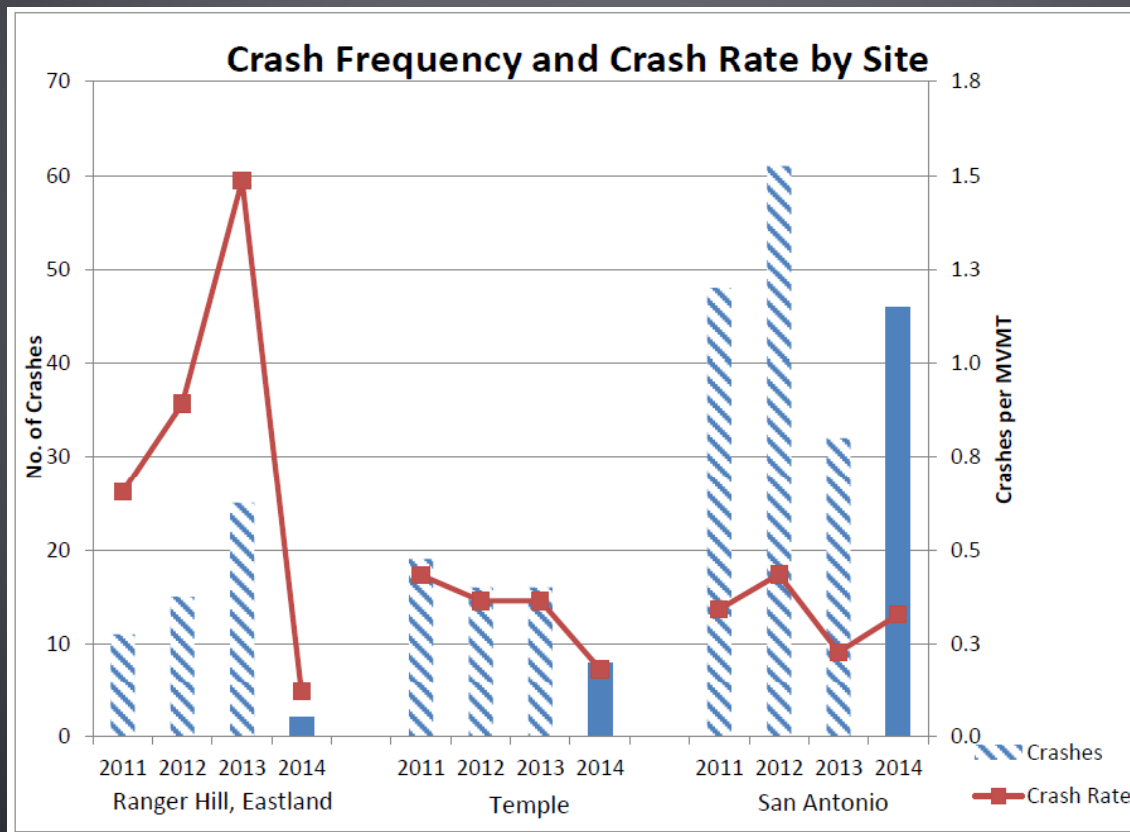

VSL Pilot Operations Statistics

- ▶ 3 month pilot period for evaluation report
- ▶ Over 400 activations of temporary speed limits
 - ▶ Most activations: congestion
 - ▶ Least activations: weather
- ▶ Typical activation duration was under an hour
 - ▶ Some activations lasted as long as 10 hours during weather events
- ▶ Speed limits typically changed multiple times per activation

VSL Pilot Effectiveness

- ▶ Reduction in number of crashes overall
 - ▶ San Antonio showed an increase from prior year
 - ▶ Other changes to roadway configuration could affect numbers

VSL Pilot Effectiveness, cont.

- ▶ Reduction in severity of crashes
 - ▶ No fatal or incapacitating crashes reported!

Lessons Learned—VSL Signs

- ▶ Portable message signs had shortcomings including:
 - ▶ Placement of the sign on the side of the road

Signs were further off the roadway than typical placements

- ▶ Non-standard speed limit sign “look”
- ▶ LEDs initially not bright enough for single pixel characters
- ▶ Ease of damage from weather events
- ▶ Additional detector deployed caused power consumption problems which affected operations of the signs

Lessons Learned—Other Hardware

- ▶ Radar detectors were co-located with VSL signs which did not allow for quickly noticing changes in speeds
- ▶ Weather devices were not available quickly enough for profiling and calibration to be adequately tested
- ▶ Friction sensor would have recovered more quickly if directed at roadway pavement rather than the shoulder
- ▶ Cameras should be deployed in conjunction with the VSL signs to verify operations of the signs

Lessons Learned—Software

- ▶ Hardware errors were ignored in the algorithm because of the quick timeframe for the pilot
 - ▶ At times a VSL site's algorithm had to be turned off because of hardware errors
 - ▶ Device errors can cause complicated algorithms!
- ▶ Additional changes would be required to handle longer segments of VSL signs
 - ▶ REDUCED SPEED AHEAD message warning sign was required
 - ▶ Might want to display additional information about WHY the speed limits were lowered
- ▶ Algorithm favored 5 MPH speed drops between consecutive signs
 - ▶ For congestion, this often resulted in lowered speed limits upstream but before the drivers could see any traffic slowdown
 - ▶ May need to be adjusted to favor steeper reductions in some cases

Lessons Learned—Rural

- ▶ Approvals handled by a different district added complexity
 - ▶ Website was critical to providing current information to FTW
 - ▶ Network connectivity between the districts was now REQUIRED or VSL was NOT activated!
- ▶ Hardware issues more difficult to handle
 - ▶ Maintenance with spare hardware was MUCH further away
 - ▶ If a trip was required, had to be sure to bring EVERY possible hardware replacement

Lessons Learned—General

- ▶ Public understood that lowered speed limits were enforceable and could result in tickets
 - ▶ But, they did not always obey them!
 - ▶ Drivers were more observant of the lowered speed limits while law enforcement was present (no surprise!)
 - ▶ For the pilot, law enforcement did not enforce lowered speed limits or issue tickets
- ▶ Communication pathway should be as failure resistant as possible
 - ▶ Device failures can result in inconsistent speed limit displays

Questions?

Site Specific Algorithm Settings

Configuration Value	San Antonio (congestion site)	Temple (construction site)	Ranger Hill (weather site)
V^T	n/a	n/a	500'
F^{LT}	0.25 (25%)	0.25 (25%)	0.25 (25%)
F^{UT}	0.45 (45%)	0.55 (55%)	0.45 (45%)
Speed1	60	45	55
Speed2	45	30	45
Speed3	n/a	n/a	50
Speed4	n/a	n/a	40

- ▶ Final settings for each location, original friction settings were higher
- ▶ Only Ranger Hill had a visibility sensor
- ▶ Configurable to allow specific roadway types and conditions to be considered
 - ▶ Area district engineers approved settings

VSL Activation Algorithm

- ▶ Algorithm was run once per minute
- ▶ Setting speed limit values used the following rules:
 - ▶ Step downs occurred in 5-15 MPH increments with 5 MPH preferred
 - ▶ Where a larger step down than allowed would be required, the speeds displayed were higher than would have been generated
 - ▶ If a larger step down was required on one VSL sign than other VSL signs, the first sign showed the larger drop in speed
 - ▶ For the pilot, speeds were stepped down when activated, but not necessarily back up on deactivation
 - ▶ Step ups may occur between two slow target speeds
